## ***Anvil Carbon Management provides visibility of your scope 3 Greenhouse Gas (GHG) emissions that extend across the entire supply base***

Anvil's Carbon Management is a suite of innovative procurement analytics developed to make procurement professionals more effective at every stage of the procurement lifecycle. Our latest addition, Carbon Management helps you to baseline and track reductions in GHG emissions in the supply base.

Our approach aligns with the GHG Protocol and provides a new level of understanding of your GHG emissions both at an organisational level but also at the division, site and category level thereby making the insight actionable.

Corporate disclosure of Greenhouse Gas (GHG) emissions has gained momentum over recent years due to a convergence of regulatory requirements, public pressure, and investor concerns over the impact of climate change-related risks on corporate performance. Most publicly listed companies already disclose Scopes 1 and 2 emissions on a regular basis, and attention is turning towards Scope 3 emissions disclosure. Up to 90% of a company's GHG emissions come from the supply base, which means that procurement has a great opportunity to step up and lead on climate change. Carbon Management provides the visibility to manage scope 3 GHG emissions and begin the path to carbon neutral and on towards Net Zero.

Carbon Management accesses approved data sources and aligns with the GHG Protocol and guidance to provide a view of your carbon footprint by category. As a part of the set-up, we tune the model to better reflect your specific context. The tool is particularly strong in the reporting of indirect categories of spend which are often the most difficult to assess. Carbon Management sits within a broader group of modules, including our very own Project Management which it utilises to manage all calibration, mitigation and offset projects. The resultant analysis can be delivered as a standalone solution or combined with Spend, Contract and Risk analytics and reporting for customers of our platform.

Ideally, we would not use carbon credits to achieve carbon neutrality. However, they do play a useful role in funding projects that reduce and capture GHG as well as delivering against other UN social development goals (SDG's). As a member of a carbon trading exchange Carbon Management clients can access these offsets at market prices without the fees of intermediaries.

"Procurement must step up and lead on climate change. Carbon Management helps procurement professionals to proactively engage with their supply base. By making carbon a dimension of every supplier relationship our clients are finding innovative and collaborative ways to reduce their carbon footprint" Steve Harrison CEO at Anvil Analytical

"The market needs this kind of analytical service to drive progress", Jo Ennion Group Sustainability Lead at Sainsbury's.
